## ALIGNMENTS

RESULT 1

melanoma antigen MAGE-3 - human
NiAlternate names: MAGE 3 protein
C;Species: Homo sapiens (man)
C;Species: 20-Feb-1995 #sequence revision 20-Feb-1995 #text\_change 18-Feb-2000
C;Accession: JC2361; PH1296; I38438
R;Ding, M; Beck, R.J; Keller, C.J.; Fenton, R.G.
Biochem. Biophys. Res. Commun. 202, 549-555, 1994
A;Title: Cloning and analyais of MAGE-1-related genes.
A;Reference number: JC2358; MUID:94311935; PMID:8037761

A; Accession: JC2361

A; Molecule type: mRNA

A; Residues: 1-314 <DIN>
A; Experimental source: melanoma cell line DM150
A; Experimental source: melanoma cell line DM150
B; Traversari, C.; van der Bruggen, P.; Luescher, I.F.; Lurquin, C.; Chomez, P.; Van Pel, J. Exp. Med. 176, 1453-1457, 1992
A; Title: A nonapeptide encoded by human gene MAGE-1 is recognized on HLA-A1 by cytolytic A; Reference number: PH1294; MUID:93018875; PMID:1402688

A;Accession: PH1296
A;Molecule type: DNA
A;Molecule type: DNA

Species: chloroplast Eremothamnus marlothianus

C.Species: chloroplast Eremothamnus marlothianus

C.Species: chloroplast Eremothamnus marlothianus

C.Accession: T13.073

R.Kim, K.J.; Jansen, R.K.

Proc. Natl. Acad. Sci. U.S.A. 92, 10379-10383, 1995

A.Title: NdhF sequence evolution and the major clades in the sunflower family.

A.Reference number: Z17549; MUID:96036088; PMID:7479788

A.Accession: T13073

A.Status: preliminary; translated from GB/EMBL/DDBJ

A.Status: DNA

A.Resiques: 1-743 < KIM>
A.Resiques: 1-743 < KIM>

-!- FUNCTION: NOT KNOWN, THOUGH MAY PLAY A ROLE IN TUMOR
TRANSFORMATION OR ASPECTS
-!- TISSUE SPECIFICITY: EXPRESSED IN MANY TUMORS OF SEVERAL TYPES,
SUCH AS MELANOMA, HEAD AND NECK SQUAMOUS CELL CARCINOMA, LUNG
CARCINOMA AND BREAST CARCINOMA, BUT NOT IN NORMAL TISSUES EXCEPT Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi; Mammalia; Eutheria; Primates; Catarrhini; Hominidae; Homo. MAGC\_HUMAN STANDARD; PRT; 314 AA.

"Human gene MAGE-3 code for an antigen recognized on a melanoma by autologous cytolytic T lymphocytes.";
J. Exp. Med. 179:921-930(1994).
-!- FUNCTION: Not known, though may play a role in embryonal development and tumor transformation or aspects of tumor progression. Antigen recognized on a melanoma by autologous cytolytic T lymphocytes.
-!- TISSUE SPECIFICITY: EXPRESSED IN MANY TUMORS OF SEVERAL TYPES, SICH AS MELANOMA, HEAD AND NECK SQUAMOUS CELL CARCINOMA, LUNG CARCINOMA, HAD AND BREAST CARCINOMA, BUT NORMAL TISSUES EXCEPT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- COFACTOR: Zinc (By similarity).
-!- PATHWAY: Glycosylation; early steps of mannosylation.
-!- SUBCELLULAR LOCATION: Cytoplasmic (Probable).
-!- SIMILARITY: Belongs to the mannose-6-phosphate isomerase family 1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Smith D.J., Payton M.A.;

-!- FUNCTION: Involved in the synthesis of the GDP-mannose and
dolichol-phosphate-mannose required for a number of critical
mannosyl transfer reactions.
                                                                                                                                                                                                                                                        GENEW; HGMC:6802; MAGEA4.

Kim Y.-M., Ahn K.-J., Beppu T., Uozumi T.;

"Nucleotide sequence of the niflA operon of Klebsiella oxytoca NG13
and characterization of the gene products.";

Mol. Gen. Genet. 205:253-259(1986).

-!- FUNCTION: NIFPA, A TRANSCRIPTIONAL ACTIVATOR, IS REQUIRED FOR
ACTIVATION OF MOST NIF OPERONS, WHICH ARE DIRECTLY INVOLVED IN
NITRAGEN FIXATION. NIFA INTERACTS WITH SIGMA-54 (BY SIMILARITY).

-!- SIMILARITY: Contains 1 sigma-54 factor interaction ATP-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Bacteria; Proteobacteria; Gammaproteobacteria; Enterobacteriales;

-!- CATALYTIC ACTIVITY: D-fructose 1,6-bisphosphate = glycerone phosphate + D-glyceraldehyde 3-phosphate.
-!- COFACTOR: Zinc.
-!- PATHWAX: Glycolysis; sixth step.
-!- SIMILARITY: Belongs to class II fructose-bisphosphate aldolase family.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               CATALYTIC ACTIVITY: Anthranilate + phosphoribosyldiphosphate = No.5.-phosphoribosyl-anthranilate + diphosphate.
PATHWAY: Tryptophan biosynthesis; second step.
SIMILARITY: Belongs to the anthranilate phosphoribosyltransferase
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DNA damage; DNA replication; DNA-binding; SOS response; DNA repair; ATP-binding; Complete proteome.

-!- FUNCTION: Exhibits a very high intrinsic GTPase hydrolysis rate.

-!- FUNCTION: Exhibits a very high intrinsic GTPase hydrolysis rate.

Involved in the biosynthesis of the hypermodified nucleoside 5-
methylaminomethyl-2-thiouridine, which is found in the wobble
position of some tRNAs (By similarity).

-!- SIMILARITY: Belongs to the era/trmE family of GTP-binding
proteins. TrmE subfamily.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Mycoplasma pneumoniae.

This kinase associates with the IL-1 receptor IL1-R-1. This association is rapid and IL-1 dependent (By similarity).

-i-SUBGNIT: Found in a complex containing TRAFE, PELL1 and IRAK4.

Interacts with PELL3 (By similarity). Interacts with PELL2.

-i-TISSUE SPECIFICITY: Highly expressed in liver, followed by kidney.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     "Cutting edge: mouse pellino-2 modulates IL-1 and lipopolysaccharide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                -!- DEVELOPMENTAL STAGE: Expressed from Ell day to El8 day.
-!- PTM: Autophosphorylated. An extensive phosphorylation of IRAK occurs after its association with IL1-R-1. This step could be linked to the activation of the kinase (By similarity).
-!- SIMILARITY: BELONGS TO THE SER/THR FAMILY OF PROTEIN KINASES.
PELLE SUBFAMILY.

        Oncogene 9:3057-3421.,

Oncogene 9:3057-3061(1994).

-!- FUNCTION: Upon binding to EGF receptor enhances EGF-dependent mitogenic signals. Can bind multiple cellular targets.

-!- TISSUE SPECIFICITY: Expressed in all tissues analyzed, including heart, brain, placenta, lung, liver, skeletal muscle, kidney and pancreas. Expressed in all epithelial and fibroblastic lines examined and in some, but not all, hematopoietic cells.

-!- PTM: Phosphorylated by several receptor tyrosine kinases.

-!- SIMILARITY: Contains 1 PH domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

Natl. Acad. Sci. U.S.A. 99:4668-4673(2002).
-!- FUNCTION: Reversibly transfers an adenylyl group from ATP to 4'--
phosphopantetheine, yielding dephospho-CoA (dPCoA) and
pyrophosphate (By similarity).
-!- CATALYTIC ACTIVITY: ATP + pantetheine 4'-phosphate = diphosphate +
